ROAD PAVEMENTS - UNBOUND, CEMENT AND OTHER HYDRAULICALLY BOUND MIXTURES

Unbound Mixtures for Subbase

801 General Requirements for Unbound Mixtures requirement categories in Table 8/1 and Clauses 802 to 806. The permitted alternatives for each part of the Permanent Works shall be as described in Appendix 7/1.

1 Unbound mixtures shall be made and constructed to conform to BS EN 13285, the

Table 8/1: Mixture and Grading Requirement Categories for Unbound Mixtures

Unbound mixture	Type 1	Type 2	Type 3 (open graded)	Category B (close graded)	Type 4 (asphalt arisings)

2 Unbound mixtures shall not be deposited within 500 mm, or any other distances described in Appendix 7/1, of concrete, cement bound materials, other cementitious mixtures or stabilised capping forming part of the Permanent Works if, when tested in accordance with TRL Report 447 either:

(i) the water-soluble sulfate (WS) content exceeds 1500 mg of sulfate (as SO₄) per litre (Test No.1); or

(ii) the oxidisable sulfides (OS) content exceeds0.5% of sulfate (as SO₄) (Test No.2 and Test No.4); or

(iii) the 2:1 water to soil extract prepared for the determination of water-soluble sulfate in (i) has a pH value of less than 7.2, when tested using the electrometric method of pH determination in accordance with BS 1377-3.

At least five samples of each material shall be tested for WS, OS and pH value. The mean of the highest two values shall be used for comparison with the limiting values. This also applies if six to nine

November 2011

results are available. If ten or more results are available, the mean of the highest 20% of the results shall be used for comparison with the limiting values.

3 Unbound mixtures shall not be deposited within 500 mm, or any other distances described in Appendix 7/1, of metallic structural elements forming part of the Permanent Works if, when tested in accordance with TRL Report 447 either:

- (i) the water-soluble sulfate (WS) content exceeds 300 mg of sulfate (as SO₄) per litre (Test No.1); or
- (ii) the oxidisable sulfides (OS) content exceeds 0.06% of sulfate (as SO₄) (Test No.2 and Test No. 4).

At least five samples of each material shall be tested for WS and OS. The mean of the highest two values shall be used for comparison with the limiting values. This also applies if six to nine results are available. If ten or more results are available, the mean of the highest 20% of the results shall be used for comparison with the limiting values.

6 (11/04) When required by Appendix 7/1 and Clauses

803 and 804 as appropriate, the unbound mixture shall satisfy the minimum CBR requirement of Appendix 7/1 when tested in accordance with clause 7 of BS 1377-4, with surcharge discs. The specimens shall be tested in a soaked condition.

November 2011

The mixture shall be tested at the density and moisture content likely to develop in equilibrium field conditions which shall be taken as being the density relating to the uniform air voids content of 5% and the value of optimum water content declared when tested as required by BS EN 13285.

Frost Heave

7 Not Used

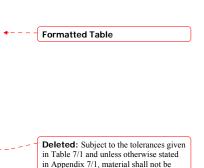

8 Not Used

<u>802</u> (11/04) Transport, Laying, Compaction and _ _ Trafficking of Unbound Mixtures

Transporting

1 Unbound mixtures shall be protected from drying out and segregation both during transit to the point where it is to be laid and whilst awaiting tipping.

Laying

Deleted: Where permitted by Appendix

7/1

frost susceptible if it is used within 450 mm of the designed final surface of a road or paved central reserve, or 350 mm if the Mean Annual Frost Index (MAFI) of the site is less than 50.¶ Deleted: <sp><sp>

Deleted: (11/04)

2

Formatted: Indent: Left: 0 pt

2 Not Used,

3 All unbound mixtures shall be placed and spread evenly. Spreading shall be undertaken either concurrently with placing or without delay. Unbound mixtures shall be spread using a paving machine or a suitable spreader box and operated with a mechanism which levels off the material to an even depth.

4 Except where otherwise stated in Appendix 7/1, material up to 225 mm compacted thickness shall be spread in one layer so that after compaction the total thickness is as specified. Material of compacted thickness greater than 225 mm shall be laid in two or more layers and the minimum compacted thickness of any such layer shall be 110 mm. Where the layers of_unbound mixtures are of unequal thickness, the lowest layer shall be the thicket layer.

Compaction

5 Compaction shall be completed as soon as possible after the mixture has been spread and in accordance with the requirements for the individual mixtures.

6 Full compaction shall be obtained over the full area including in the vicinity of both longitudinal and transverse joints.

7 _____(i) Compaction of unbound mixtures shall be carried out by a method specified in Table 8/4, unless the Contractor demonstrates at site trials that a state of compaction achieved by an alternative method is equivalent to or better than that using the specified method.

(ii) At the end of compaction as indicated in (i) the _____ requisites indicated in (a) and (b) shall apply:

a. The compaction degree based on the Standard Proctor Test according to BS 1377: Part 4 shall not fall below $D_{pr} = 103\%$.

b. When tested in according to the standard DIN 18134 the reaction modulus E_{v2} shall comply with the values indicated in Charts 1, 2, 3 and 5 of the Transport Malta Design and Construction Standards for Road Works, Volume 7, "Directives for the Standardization of Pavements for Traffic Areas". The ratio E_{v2}/E_{v1} shall not exceed 2.2. In only those cases where the value E_{v1} is at least 60% of the required E_{v2} value higher ratios than 2.2 may be submitted to the Overseeing Organisation for review, and subsequent acceptance or rejection.

c. <u>The following tolerances are permissible in production control and control testing for (a) and (b):</u>
Less than five test values: all values have to be above

the minimum value.

- Five or more test values; one value may fall below the required value by 10%.

8 The surface of any layer of material shall on completion of compaction and immediately before overlaying, be well closed, free from movement under construction plant and from ridges, cracks, loose material, pot holes, ruts or other defects. All loose, segregated or otherwise defective areas shall be removed to the full thickness of the layer, and new material laid and compacted.

9 For the purposes of Table 8/4 the following shall apply:

The number of passes is the number of times that each point on the surface of the layer being compacted shall be traversed by the item of compaction plant in its operating mode (or struck, in the case of power rammers).

The compaction plant in Table 8/4 is categorised in terms of static mass. The mass per metre width of roll is the total mass on the roll divided by the total roll width. Where a smooth-wheeled roller has more than one axle, the category of the machine shall be determined on the basis of the axle giving the highest value of mass per metre width.

For pneumatic-tyred rollers the mass per wheel is the total mass of the roller divided by the number of wheels. In assessing the number of passes of pneumatic-tyred rollers the effective width shall be the sum of the widths of the individual wheel tracks together with the sum of the spacings between the wheel tracks provided that each spacing does not exceed 230 mm. Where the spacings exceed 230 mm the effective width shall be the sum of the widths of the individual wheel tracks only.

Deleted: ¶

"unbound mixtures are of unequal thickness, the lowest layer shall be the thickest layer.¶

Compaction

5 Compaction shall be completed as soon as possible after the mixture has been spread and in accordance with the requirements for the individual mixtures.¶

⁶ Full compaction shall be obtained over the full area including in the vicinity of both longitudinal and transverse joints.¶

Formatted: Font: Not Bold

Deleted: Unbound mixtures in a frozen condition shall not be incorporated in the Works but may be used, if acceptable, when thawed. Unbound mixtures shall not be laid on any surface which is frozen or covered with ice.¶

Formatted: Font: Not Bold

Formatted: Indent: Left: 0 pt Deleted: September 2010

3

its area in contact with compacted material.

- (iv) Vibratory rollers are self-propelled or towed smooth-wheeled rollers having means of applying mechanical vibration to one or more rolls:
 - (a) The requirements for vibratory rollers are based on the use of the lowest gear on a self-propelled machine with mechanical transmission and a speed of 1.5-2.5 km/h for a towed machine or a self-propelled machine with hydrostatic transmission. If higher gears or speeds are used an increased number of passes shall be provided in proportion to the increase in speed of travel.
 - (b) Where the mechanical vibration is applied to two rolls in tandem, the minimum number of passes shall be half the number given in Table 8/4 for the appropriate mass per metre width of one vibrating roll but if one roll differs in mass per metre width from the other, the number of passes shall be calculated as for the roll with the smaller value. Alternatively the minimum number of passes may be determined by treating the machine as having a single vibrating roll with a mass per metre width equal to that of the roll with the higher value.
 - (c) Vibratory rollers operating without vibration shall be classified as smooth-wheeled rollers.
 - (d) Vibratory rollers shall be operated with their vibratory mechanism operating at the frequency of vibration recommended by the manufacturer. All such rollers shall be equipped, or provided with devices indicating the frequency at which the mechanism is operating and the speed of travel. Both devices shall be capable of being read by an inspector alongside the machine.
- (v) Vibrating-plate compactors are machines having a base-plate to which is attached a source of vibration consisting of one or two eccentrically-weighted shafts:
 - (a) The mass per square metre of baseplate of a vibrating-plate compactor is calculated by dividing the total mass of the machine in its working condition by

November 2011

Formatted: Indent: Left: 0 pt Deleted: September 2010

- (b) Vibrating-plate compactors shall be operated at the frequency of vibration recommended by the manufacturer. They shall normally be operated at travelling speeds of less than 1 km/h but if higher speeds are necessary, the number of passes shall be increased in proportion to the increase in speed of travel.
- (vi) Vibro-tampers are machines in which an engine driven reciprocating mechanism acts on a spring system, through which oscillations are set up in a base-plate.
- (vii) Power rammers are machines which are actuated by explosions in an internal combustion cylinder; each explosion being controlled manually by the operator. One pass of a power rammer shall be considered to have been made when the compacting shoe has made one strike on the area in question.
- (viii) Combinations of different types of plant or different categories of the same plant will be permitted; in which case the number of passes for each shall be such proportion of the appropriate number in Table 8/4 as will together produce the same total compactive effort as any one operated singly, in accordance with Table 8/4.

Use of Surfaces by Construction Plant and Other Traffic

10 Construction plant and other traffic used on pavements under construction shall be suitable in relation to the material, condition and thickness of the courses it traverses so that damage is not caused to the subgrade or the pavement courses already constructed. The wheels or tracks of plant moving over the various pavement courses shall be kept free from deleterious materials.

11 Where the Contractor proposes to use the unbound mixture layers for construction plant he shall improve these layers where necessary, to accommodate the method of construction and the type of plant and vehicles which he proposes to use,

November 2011

in order to avoid damage to the laid layer(s), any capping and the subgrade. Any permanent thickening shall be across the whole width of the pavement. Temporary thickening shall not impede drainage of any layer or the subgrade.

Trafficking Trial

12 When required by Appendix 7/1, the Contractor shall undertake a Trafficking Trial incorporating the unbound mixture proposed for use in the Permanent Works. A trial area shall be constructed, trafficked and assessed in accordance with the procedure described in sub-Clauses 13 to 18 of this Clause. The mean vertical deformation after 1000 equivalent standard axles shall be less than 30 mm when measured in accordance with the procedure stated in sub-Clause 17 of this Clause.

Proposals for trafficking trials shall be submitted to the Overseeing Organisation for review and acceptance five days in advance of construction.

Trial Procedure

13 The trial area shall be located on a formation prepared in accordance with the Specification. The trial area may be located so that it can be incorporated within the Permanent Works if the resistance to wheel

•

track rutting is demonstrated to comply with sub-Clause 12 of this Clause.

14 The trial area shall be at least 60 m long, and of sufficient width that when trafficked, the wheel paths of the test vehicle shall be at least 1 m from either edge of the top of the unbound mixture layer. The unbound mixture layer shall be compacted to the thickness specified in Appendix 7/1. The formation shall extend for a further 1 m either side of the unbound mixture layer.

15 A sufficient run off/run on area shall be constructed at each end of the trial area of the same width, and compacted to the same level, as the trial area, to ensure correct tracking by the test vehicle and minimise dynamic effects of the vehicle bouncing on its springs. Suitable guidance shall be given to assist the driver in maintaining the same track in each pass and to achieve channelled trafficking. Examples of suitable guides would be a string or painted line.

Mixtures

I

16 The unbound mixture used in the trial shall be transported, laid and compacted using the equipment proposed for use in the Works.

17 Maximum vertical deformation shall be measured in both wheel tracks using optical or laser levels at pre-determined monitoring points on five transverse

Road Pavements - Unbound, Cement and Hydraulically Bound Mixtures

lines spaced equally along the length of the trial bay. The transverse lines at the ends of the trial area shall be at least 5 m from the run off/run on areas. The average deformation of the two wheel tracks after 1000 standard axles shall be recorded.

Reporting and Acceptance of Trafficking Trial Area

18 The Contractor shall provide the Overseeing Organisation, for acceptance, with a report on the Trafficking Trial, stating how the use of the unbound mixture was validated. The main construction of the Permanent Works shall not start until the Trafficking Trial area has been accepted by the Overseeing Organisation within two working days of receiving the Trafficking Trial area report.

803 Type 1 Unbound Mixtures

1 Type 1 unbound mixture shall be made from crushed rock, crushed slag, crushed concrete or recycled aggregates

2 The mixture shall comply with BS EN 13285 and the requirements of Table 8/1. The grading requirements for the mixture are summarised in Table 8/5.

Deleted:

Deleted: or well burnt non-plastic shale Deleted: and may contain up to 10% by mass of natural sand that passes the 4 mm test sieve. Where permitted by Appendix 7/1, crushed gravel complying with sub-Clause 803.7 may be used.

807 Type 4 (asphalt arisings) Unbound Mixtures

1 Type 4 unbound mixture shall be made from recycled aggregates containing asphalt arisings, and may contain crushed rock, crushed slag or crushed concrete that passes the 4 mm size test sieve.

2 Asphalt arisings shall be either asphalt road planings or granulated asphalt, but excluding materials containing tar or tar-bitumen binders. Asphalt planings are defined as materials derived from the asphalt layers of the pavement using a mobile machine fitted with milling cutters. Granulated asphalt is defined as asphalt bound material recycled from roads under reconstruction or surplus asphalt material destined for bound pavement layers, but unused, which has been granulated.

3 Type 4 unbound mixture shall have an asphalt (Class Ra) _ content greater than 50% when tested in accordance with Clause 710, and the recovered bitumen content of the asphalt shall be not more than 10% when tested in accordance with _

4-Type 4-unbound mixture shall-comply with BS EN 13285 – and the requirements of Table 8/1. The grading requirements for the mixture are summarised in Table 8/5.

5 The properties of aggregates used in the mixture shall be in accordance with BS EN 13242 and the requirements of Table 8/2.

6 The size fraction of the unbound mixture passing the 0.425 mm size test sieve shall be non-plastic as defined by BS 1377-2 and tested in compliance therewith.

7 Where the mixture contains recycled coarse aggregate or recycled concrete aggregate, it shall comply with sub-Clause 801.5.

8 The mixture shall be transported, laid and compacted _____ without drying out or segregation, at a moisture content within the range 1% above to 2% below the declared value of optimum water content when tested as required by BS EN 13285. The moisture content shall be determined by oven drying at a reduced temperature setting of 45°C to 50°C.

9 Where required by Appendix 7/1, Type 4 unbound _ mixtures shall be assessed using a trafficking trial complying with sub-Clause 802.12.

808 and 809 Not Used

✓ 14	

part of the layer and shall meet the requirements for density in clause 870.

11 Compaction of HBM shall be carried out by vibrating roller and/or pneumatic-tyred roller (PTR). Where vibrating roller compaction is used on mixtures specified in Clauses 830 to 835 it shall be followed by at least 8 passes of a PTR with a wheel loading of not less than 30kN

12 On completion of compaction the surface shall be closed, free from ridges, cracks, loose material, visible voids, ruts, shear planes and other defects. All defective areas shall be rectified within the time period specified in sub-Clause 813.2. If rectification is not completed within the specified time period, the defective area shall be removed to the full thickness of the layer, and new mixture laid and compacted.

Cold and Wet Weather Working

13 During cold weather:

the temperature of HBM shall not be less than 5°C at the time of laying; Deleted: , other than FABM 5,

Deleted: . Only PTR compaction with a wheel loading of not less than 30kN shall be applied to FABM 5

Volume 1 Specification for Road Works

within the construction period set out in Table 8/10. Reworking shall only be permitted when the water content requirements of the reworked material are maintained within the limits stated in the method statement.

19 Before overlaying, any loose material shall be removed and replaced to the full depth of the layer or, if within the construction period set out in_Table 8/10, reworked as specified in sub-Clause 813.18.

20 Daily record sheets complying with sub-Clause 817.4 shall be submitted to the Overseeing Organisation by start of work on the next working day, detailing:

- (i) spread rate/batching record results;
- (ii) depth measurements;
- (iii) density test measurements;

(iv) sample and test locations;

I

 (v) construction period records showing the time(s) of mixing, water addition, completion of compaction and application of curing membrane.

814 Mix-in-Plant Method of Construction Using Batching by Mass

1 The HBM shall be produced in a stationary mixing plant that batches by mass and mixes in a forced-action mixer, allowing sufficient time in the mixer to produce a homogenous mixture.

2 The mixing plant shall have an automated surveillance and data collection system.2 HBM shall be transported directly to the point where it is to be laid and protected from the weather during transit and whilst awaiting tipping, unless otherwise agreed by the

2 The method statement shall include the intended mixture proportions with supporting data from trial mix results and/or historic records to justify the proportions, the water content (or MCV) limits and (if applicable) spread rates for all stages of the Work.

3 Where multiple lift working is used, the method statement shall detail the methods used to assure that bond between the individual lifts is achieved. The method statement shall also detail the procedures to be used to confirm that bond has been achieved in

November 2011

3 HBM shall be transported directly to the point where it is to be laid and protected from the weather during transit and whilst awaiting tipping, unless otherwise agreed by the Overseeing Organisation.

815 Mix-in-Plant Method of Construction Using Volume Batching

1 The HBM shall be produced in a stationary mixing plant that batches by volume and mixes in a forced action mixer, allowing sufficient time in the mixer to produce a homogenous mixture.

Overseeing Organisation.

3 Dispensing accuracy shall be verified by reconciliation between constituent deliveries and the area and depth of completed layer for each 5000 m^2 of work, or part thereof, during each day's operations.

816 Mix-in-Place Method of Construction

<u>Not Used</u>

817 Method Statement and Demonstration Area

Method Statement

1 At least 10 days prior to constructing the demonstration area specified in sub-Clause 817.5, the Contractor shall provide a full method statement for the approval of the Overseeing Organisation. The statement shall detail the operatives, plant, materials and procedures for the construction of demonstration area(s) and of the works, including procedures. The statement shall also include procedures for induced cracking, if required by Appendix 7/1, and the procedures to be applied during inclement weather, plant breakdowns and other unscheduled events.

the demonstration area and in the works.

4 The method statement shall include a sample record sheet for the submission of the data required by sub-Clause 813.20.

Demonstration Area

5 Prior to the commencement of the main works, the Contractor shall construct a demonstration area of at least 800 m^2 conforming to the submitted method statement. The demonstration area shall include a transverse end-of-day joint and (if appropriate) multiple lift working. The demonstration area may be accepted into the permanent works, where agreed by the Overseeing Organisation. Where the Contractor can produce documentary evidence of similar work carried out to this specification during the previous 6 months, the Overseeing Organisation may allow the works to proceed without the demonstration area.

6 Where multiple lift working is used, the demonstration area

Deleted: 1 Mixed-in-place HBM shall be produced by an in-situ pulverizingmixing process with the added mixing water injected directly into the mixture during the mixing process. The pulverizing-mixing process shall be repeated until a homogenous mixture is produced.¶

2 When binder constituents are dispensed onto the surface to be pulverized-mixed, the rate of spread shall be confirmed by site checks carried out in accordance with Clause 870. For each group of 5 readings the mean rate of spread of material shall be within ±10% of the stated target rate and each individual value shall be within ±15% of the mean value of the group of 5 readings.¶

³ The accuracy of the system used to dispense binder constituents shall be verified by reconciliation between constituent deliveries and the area and depth of completed layer for each 5000 m² of work, or part thereof, during each day's operations.¶

4 Mixing of fresh material shall ensure a minimum overlap of 200 mm with previously mixed material.¶

5 Where lime is used to granulate cohesive soils it shall be added and mixed with the soil using at least two passes of the pulverizer-mixer between 24 and 96 hours before the subsequent addition of cement, FA, HRB or ggbs. The surface of the layer shall be sealed by rolling immediately after adding and mixing lime. The MCV during this period, known as the mellowing period, shall comply with Clause 840.

Formatted: Indent: Left: 0 pt

/17

shall confirm the effectiveness of the procedures used to assure that bond between the individual lifts can be achieved.

7 Where induced cracking is required, the demonstration area shall include crack induction at the specified spacing. The effectiveness of the procedure used shall be checked within 28 days of construction, by recovering four evenly spaced 150 mm dia cores from the line of the induced cracks and assessing each core for compliance with sub-Clause 818.2.

8 The mixture constituents, proportions, laying and compaction plant and construction procedures used for the demonstration area shall not be changed unless the Contractor lays a further demonstration area or the changes are agreed by the Overseeing Organisation.

818 Induced Cracking of HBM

1 Where required by Appendix 7/1, transverse cracks shall be formed at the specified spacing with a tolerance of \pm 150 mm. Where the pavement is made up of two or more layers of HBM with induced cracks, the cracks in the overlying HBM layer shall align with the induced cracks in the layer below with a tolerance of \pm 100 mm.

2 Cracks shall be induced in fresh material after initial compaction. The transverse cracks shall be induced by grooving the fresh material to form straight vertical grooves not more than 20 mm wide, to a depth of between one half and two thirds of the layer thickness over the full width of the pavement. Bitumen emulsion shall be poured or sprayed into the grooves prior to final compaction, to form a crack inducing membrane. The bitumen emulsion shall comply with Class C40B4, as specified in the <u>UK</u> National Foreword to BS EN 13808. During

final compaction of the mixture, the surface of the groove shall be fully closed throughout its full length. The bitumen in the groove shall be fully encased and remain continuous, with not less than 70% of the sides of the groove coated with bitumen.

3 Where required by Appendix 7/1, longitudinal cracks shall be induced using the procedure specified in sub-Clause 818.2.

819 Not Used

820 Aggregates

1 The aggregates used in HBM shall comply with BS EN 13242 and the selected requirements listed in Table 8/12. Where recycled coarse aggregate or recycled concrete aggregate is used in HBM, it shall also be tested in accordance with Clause 710 and

November 2011

comply with the additional requirements for the proportion of the components listed in Table 8/12.

2 When required by Appendix 7/1, an existing pavement layer that is to used to produce HBM shall be tested to confirm compliance with sub-Clause 820.1.

5 The laboratory mechanical performance shall comply with the requirements of <u>BS EN 14227-1</u>, clause 6.5.2.2 (System I – Compressive Strength), and Table 8/12.2 when sampled and tested in accordance with Clause 870.

822 Cement Bound Granular Mixtures B (CBGM B)

1 Cement bound granular mixtures B (CBGM B) shall comply with BS EN 14227-1, and have binder constituent proportions complying with the requirements of Clause 811.

2 Aggregates shall comply with the requirements of Clause 820 and shall have a combined grading that complies with Envelope B from BS EN 14227-1, Figure 1. Alternatively, the total mixture grading shall comply with the grading envelope Category G2 from BS EN 14227-1, Annex B, Figure B2.

3 The strength after immersion shall be at least 80% of the non-immersed strength, when tested in accordance with the laboratory mixture design requirements specified in Clause 880.

4 The method of construction shall be in accordance with Clause 813 and Clause 814.

5 The laboratory mechanical performance shall comply with <u>BS EN 14227-1, clause 6.5.2.2</u> (System I – Compressive Strength), and Table <u>8/12.2</u> when sampled and tested in accordance with Clause 870.

4 (05/09) The method of construction shall be in accordance with Clause 813 and 814.

5 (05/09) The laboratory mechanical performance shall comply with the requirements of Appendix 7/1, when sampled and tested in accordance with Clause 870.

836 to 839 Not Used

840 Soil Treated by Cement (SC),

1 The mixture shall be as specified in Appendix 7/1 and comply with the appropriate requirements selected from Table 8/13 and the following:

(i) BS EN 14227-10, for soil treated by cement (SC);

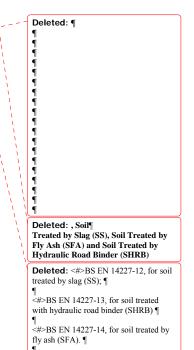

The mixture shall also have binder constituent proportions complying with the requirements of Clause 811.

2 Not less than 95% of the soil shall pass the 63 mm size test sieve when tested in accordance with EN 933-1 and the maximum particle size of the soil shall not exceed 25% of the layer depth.

3 When tested in accordance with TRL Report 447, Test No. 4, soil with a total potential sulfate (TPS) content less than 0.25% sulfate (as SO_4) shall be deemed suitable for treatment, if the laboratory mixture design procedure confirms that the mixture complies with the 'resistance to water' requirements specified in_Table 8/13. Soil with a total potential sulfate (TPS) equal to or greater than 0.25% sulfate (as SO_4) shall only be deemed suitable for treatment where agreed by the Overseeing Organisation.

4 The method of construction shall be in accordance with Clause 813 and either Clause 814, Clause 815 or Clause 816.

5 (05/09) The laboratory mechanical performance shall comply with the requirements of Appendix 7/1, when sampled and tested in accordance with Clause 870.

870 Testing, Control and Checking of HBM

General

1 Tests, controls and checks shall be carried out in accordance with the requirements in Table 8/14 and the following sub-Clauses at locations determined by the Overseeing Organisation, unless otherwise stated in Appendix 1/5. Where the Overseeing Organisation is satisfied that a consistent quality of work is being achieved it may order the frequency of testing to be reduced to half that required in Table 8/14. Where a test reference is shown in Table 8/14, the testing shall be carried out in compliance with the requirements of Clause 105 and be undertaken by an organisation accredited in accordance with BS EN ISO/IEC 17025 for the test method.

Sampling

2 Sampling shall be in accordance with BS1924-1. Where a bulk sample of HBM is taken from a layer, it shall be taken from the full depth of the layer, used without further mixing, and not combined with other bulk samples.

Spread Checks for the Mix-in-Place Method of Construction

Standardisation of Nuclear Density Gauges and Measurement of In-situ Wet Density

5 The in-situ wet density of a compacted mixture shall be measured using a calibrated nuclear density gauge in accordance with BS 1924-2 and the following sub-Clauses, except that each test shall consist of at least 3 measurements at 120 degrees to each other using the same source rod hole and the density taken as the average of the higher 2 results.

6 The operation, warming-up period if any, and standardisation of the gauge shall be carried out in compliance with the manufacturer's recommendations. The gauge shall be calibrated in accordance with BS 1924 immediately prior to the construction of the demonstration area and at least once every 28 days thereafter.

7 The gauge shall be used in the direct transmission mode of operation with the source rod lowered to within 25 mm of the bottom surface of the layer. The in-situ wet density shall be determined within two hours of completing compaction.

8 The in-situ wet density of a subbase layer shall be taken as the average value of five determinations equally spaced along a line that bisects each 1000 m^2 or part thereof laid each day. The first and fifth positions shall be located 300 mm from the edges of the laid area, or other positions agreed by the Overseeing Organisation.

9 For a subbase layer, the average in-situ wet density of the area specified in sub-Clause 870.8 shall be not less than 95% of the average wet density of the test specimens taken to determine the laboratory mechanical performance of the same area.

10 For a base layer, the average in-situ wet density of the area specified in sub-Clause 870.8 shall be not less than 95% of the wet density of the HBM at its optimum moisture content, measured using the vibrating hammer method detailed in BS 13286-4. The result of each single determination of in-situ wet density shall be not less than 92% of the wet density of the HBM at its optimum moisture content.

Laboratory Mechanical Performance

11 A bulk sample of HBM shall be taken from each of the locations in sub-Clause 870.8, after the in-situ wet density has been determined. Test specimens used to determine laboratory mechanical performance shall be made using vibratory hammer compaction, in accordance with BS EN 13286-51. Where cubes are used for the determination of compressive strength, the specimens shall be 150 mm size, unless agreed otherwise by the Overseeing Organisation.

weighing the amount of material retained on five trays (or mats) of known area laid in the path of the spreading machine. The trays (or mats) shall be positioned at points equally spaced along a diagonal bisecting line the area of coverage so as to assess the full width of discharge from the spreading machine. **Deleted:** The depth of mixing shall be

Deleted: The rate of spread of added

constituents shall be determined by

Deleted: The depth of mixing shall be checked by excavation and inspection on completion of each stage of the pulverizing-mixing process. The depth of mixing shall be referenced to the design levels for the pavement by precise leveling of the stabilized soil interface (or other techniques approved by the Overseeing Organisation) to ensure that the level at the underside of the stabilized layer is in accordance with the specified recuirements.

site control purposed, HBM may be assessed on the basis of 7 days strength (or other agreed age) where the Contractor so requests, provided that a robust correlation is established between 7 days and 28 days strength using representative samples of the aggregates and binder used in the works.

12 Compliance of the area specified in sub-Clause 870.8 shall be assessed using the results for test specimens that are cured and tested in accordance with Table 8/15 using either compression or indirect tensile testing as appropriate to the class of mechanical performance specified in Appendix 7/1. Assessment shall be made using the following criteria:

(i) Compressive strength:

The requirement specified in Appendix 7/1 shall be deemed to be satisfied if the average compressive strength of the group of specimens in Table 8/14 is equal to or greater than the minimum for the specified R_c class and no individual test result is less than 67% of the minimum strength requirement for the R_c class.

(ii) Indirect tensile strength:

November 2011

The requirement specified in Appendix 7/1 shall be deemed to be satisfied if the average indirect tensile strength of the group of specimens in Table 8/14 is equal to or greater than the minimum requirement and no individual result is less than 67% of the minimum requirement appropriate to the E value determined during the laboratory mixture design procedure specified in Clause 880.

For the purposes of this specification, any reference to 'characteristic strength' in BS EN14227-1 shall be superseded by the requirements of this sub-Clause.

871 Determination of the Coefficient of Linear Thermal Expansion

Scope

1 The test method described in this Clause shall be used to determine the coefficient of linear thermal expansion of HBM within the normal range of temperature for pavement layers. The test method shall be carried out using hardened specimens.

Apparatus

2 The following apparatus shall be used:

(i) A water bath with sufficient capacity to accommodate three test specimens and capable of maintaining predetermined temperatures between 15°C and 60°C.

(ii) A device capable of measuring linear dimensions of not less than 275 mm to an accuracy of ± 0.002 mm, with a known temperature correction factor.

(ii) Vibrating hammer compaction apparatus capable of producing 150 mm diameter cylindrical test specimens, in accordance with BS EN 13286-51. The apparatus shall be suitably modified to manufacture 300 mm long test specimens.

Test procedure

3 The following test procedure shall be followed:

(i) Compact three 150 mm diameter test specimens, 300 mm in length, in accordance with BS EN 13286-51 but using six layers, each with a nominal depth of 50 mm.

(ii) Mark each specimen with 3 pairs of permanent reference points, aligned longitudinally. One of each pair shall be at opposite ends of the specimen. Each pair shall be located at 120° around the circumference of the specimens, aligned parallel to the axis, and not more than 30 mm from each end of the specimen.

(iii) Cure the specimens using the procedure specified for the determination of mechanical laboratory performance in Table 8/15.

(iv) Saturate the test specimens, either at atmospheric pressure or under vacuum, until the increase in the surface dried mass of each specimen, determined using two readings taken at least 24 hours apart, is less than 1%.

(v) Immerse the specimens in the water bath at a constant temperature (T1), maintained to an accuracy of $\pm 2^{\circ}$ C, for 24 ± 2 hours. Then measure the length (L1) of each test specimen at the locations defined by the three pairs of reference points. Repeat the measurement of length every 24 hours, until the change in length between successive measurements is less than 0.004 mm.

(vi) Raise the temperature of the water bath by at least 30°C and record the temperature (T2). T2 shall not exceed 55°C. Maintain the temperature at T2 \pm 2°C for 24 \pm 2 hours and measure the length (L2) using the procedure in (v).

(vii)Lower the temperature of the water bath by at least 30°C and record the temperature (T3). Maintain the temperature at T3 \pm 2°C for 24 \pm 2 hours and measure the final length (L3) using the procedure in (v).

Calculations

4 Calculate the Coefficient of Linear Thermal Expansion (C_{LE}) as follows:

(i) For each pair of reference points for the heating sequence calculate:

 C_{LE} '=(L2 – L1) / (T2 – T1), giving 9 results in total.

- (ii) Reject the highest and lowest results and record the mean value of C_{LE}' for the remaining 7 results.
- (iii) For each pair of reference points for the cooling sequence calculate:

 $C_{LE}^{\prime\prime} = (L2 - L3) / (T2 - T3)$, giving 9 results in total.

(iv) Reject the highest and lowest results and record the mean value of C_{LE} '' for the remaining 7 results.

(v) Calculate:

 $C_{LE} = 0.5$ ((Mean value of C_{LE}) + (Mean value of CLE')).

(vi) Check that the mean values of C_{LE} and C_{LE} lie in the range $0.95C_{LE}$ to $1.05C_{LE}$. If the mean values lie outside this range, repeat the procedure in sub-Clause 871.3.

Reporting of Results

5 Report the value of C_{LE} using units of m.10⁻⁶/°C, expressed to the nearest whole number.

872 to 879 Not used

880 Laboratory Mixture Design Procedure

1 Prior to the commencement of the work or any change in mixture constituents, the Contractor shall determine the target proportions of the constituents, including water, for the specified HBM, based on the mixture design procedure described in this Clause.

2 The mixture design procedure shall determine the properties of the HBM at a minimum of 3 values of binder contents, and a minimum of 2 values of water content for each value of binder content.

1	Formatted: Indent: Left: 0 pt	
_1	Deleted: September 2010	

Immediate Stability

3 When required, the mixture design procedure shall include the determination of the immediate bearing index (IBI) at the selected design water and binder content, measured in accordance with BS EN 13286-47. The IBI value shall be taken as the average value for a set of 3 test specimens.

Resistance to Water – Strength After Immersion

4 The strength after immersion in water shall be assessed by comparing the average strength and condition of:

- 3 specimens initially cured in a sealed condition for 14 days at the test temperature; and then removed from their moulds and immersed in aerated water for 14 days at the same test temperature.
- (ii) 3 specimens cured in sealed condition for 28 days at the same test temperature.

The immersed specimens shall be unconfined and have water in contact with all surfaces. On completion of the immersion stage of the test the specimens shall show no signs of cracking or swelling.

5 For mixtures containing less than 3% by dry mass of the mixture of cement, the test temperature shall be $(40 \pm 2)^{\circ}$ C. For mixtures containing 3% or more cement, the test temperature shall be $(20 \pm 2)^{\circ}$ C.

Resistance to Frost Heave

Not Used

I

Deleted: (05/09) HBM shall be deemed resistant to frost heave where the compressive strength class is C3/4 or greater or R_{it} is greater than 0.25 MPa, when cured in accordance with Table 8/15.

1 (05/00) Comment hound granular mixtures C (CRCM C) shall comply with RS EN 14227 1 and have		

1 (05/09) Cement bound granular mixtures C (CBGM C) shall comply with BS EN 14227-1, and have binder constituent proportions complying with the requirements of Clause 811.

2 (05/09) Aggregates shall comply with the requirements of Clause 820 and shall have a total mixture grading that complies with grading envelope Category G1 from BS EN 14227-1, Annex B, Figure B2 for 0/20 size mixtures, Figure B3 for 0/14 mm size mixtures or Figure B4 for 0/10 mm size mixtures.

3 (05/09) The compacity of the mixture shall be at least 0.8, when calculated in accordance with BS EN 14227-2, Annex C. The maximum dry density value used for the calculation shall be determined in accordance with BS EN 13286-50, using the modified Proctor (4.5 kg rammer) procedure from BS EN 13286-2.

4(05/09) The strength after immersion shall be at least 80% of the non-immersed strength, when tested in accordance with the laboratory mixture design requirements specified in Clause 880.

Page 20: [72] Deleted	Briffa Joseph	8/3/2010 9:36:00 AM
5 The method of construction shall be in accordance with Clause 813 and Clause 814.		

6 The laboratory mechanical performance shall comply with the requirements of Appendix 7/1, when sampled and tested in accordance with Clause 870.

Page 20: [73] Deleted	Briffa Joseph	7/15/2010 1:35:00 PM	
1 The mixture shall comply with the	requirements of BS EN 14227-2	for Slag Bound Mixture B2 or the	
requirements of BS EN 14227-3 for Fly Ash Bound Mixture 2 or the requirements of BS EN 14227-5 for			
Hydraulic Road Binder Bound Mixture 2, as specified in Appendix 7/1, and have binder constituent			
proportions complying with the requi	irements of Clause 811.		

2 (05/09) Aggregate shall comply with the requirements of Clause 820.

3 (05/09) SBM B2 shall have a total mixture grading that complies with grading envelope Category G1 or G2 from BS EN 14227-2, Figure 5 for 0/20 size mixtures, Figure 6 for 0/14 mm size mixtures or Figure 7 for 0/10 mm size mixtures.

4 (05/09) FABM 2 shall have a total mixture grading that complies with grading envelope Category G1 or G2 from BS EN 14227-3, Figure 3 for 0/20 size mixtures, Figure 5 for 0/14 mm size mixtures or Figure 7 for 0/10 mm size mixtures.

5 (05/09) HRBBM 2 shall have a total mixture grading that complies with grading envelope

Category G1 or G2 from BS EN 14227-5, Figure 2 for 0/20 mm size mixtures, Figure 3 for 0/14 mm size mixtures and Figure 4 for 0/10 mm size mixtures

6 (05/09) The strength after immersion shall be at least 80% of the non-immersed strength, when tested in accordance with the laboratory mixture design requirements specified in Clause 880.

7 (05/09) The method of construction shall be in accordance with Clauses 814 and 813.

8 (05/09) The laboratory mechanical performance shall comply with the requirements of Appendix 7/1, when sampled and tested in accordance with Clause 870.

Page 20: [74] Deleted	Briffa Joseph	7/15/2010 1:39:00 PM
1 (05/09) The mixture shall comply with the requirements of BS EN 14227-2 for Slag Bound Mixture B3		
or the requirements of BS EN 14227	-3 for Fly Ash Bound Mixture 3 of	r the requirements of

BS EN 14227-5 for Hydraulic Road Binder Bound Mixture 3, as specified in Appendix 7/1, and have binder constituent proportions complying with the requirements of Clause 811.

2 (05/09) Aggregate shall comply with the requirements of Clause 820.

6 (05/09) The mixture design procedures specified in Clause 880 shall include the determination of the immediate bearing at the target water and binder content. The mixture shall comply with Immediate Bearing Index Category IPI_{40} . When approved by the Overseeing Organisation, and where the mixture is not subject to direct trafficking, the mixture shall comply with Immediate Bearing Index Category IPI_{25} .

7 (05/09) The requirements of Clause 832.6 shall not apply if the mixture contains at least 3% cement by mass of the dry mixture and traffic is not permitted to use the layer for the first 7 days.

Page 20: [75] Deleted	Briffa Joseph	8/3/2010 10:49:00 AM
the requirements of Appendix 7/1,		
Page 20: [76] Deleted	Briffa Joseph	7/13/2010 5:07:00 PM

1 (05/09) The mixture shall comply with

BS EN 14227-3 for Fly Ash Bound Mixture 5, and have binder constituent proportions complying with the requirements of Clause 811.

2 (05/09) The strength after immersion shall be at least 80% of the non-immersed strength, when tested in accordance with the laboratory mixture design requirements specified in Clause 880.

3 (05/09) For lime-treated fly ash mixtures with gypsum added as an additional constituent, the method of construction shall be in accordance with Clause 813 and 814. For other mixtures, the method of construction permitted shall comply with Clause 813 and either Clause 814, Clause 815 or Clause 816.

4 (05/09) The laboratory mechanical performance shall comply with the requirements of Appendix 7/1, when sampled and tested in accordance with Clause 870.
